# Introduction

Buttons are key parts of user interfaces they come in different shapes and sizes for actions like signing up, logging in, and clicking links.

# Button categories

There are 3 main categories of buttons based on how users are expected to interact with them primary, secondary, and tertiary.

**Primary**

**Secondary**

**Tertiary**

# Use color to attract

Color quickly shows meaning in design. It guides users to important buttons. For example, red often means alerts or delete actions.

Are you sure you want to  
delete this message?

# Choose clear fonts

Be creative, but be careful with button design  
Balance is important; buttons should be eye catching and functional.

# Set button width

Set a minimum width for buttons that change size. Narrow buttons can be hard to click, look strange, or lose importance.

# Prioritize buttons

Button hierarchy helps users. Make primary buttons, like "Submit," easy to see, and secondary buttons, like "Cancel," less visible.
